INSURE — Humanized Guide & Visual Scenarios

PLAIN-ENGLISH EXPLANATIONS, LIVE SCENARIOS & PICTORIAL SYSTEM DIAGRAMS

Team: **Techsquad** (SYNAPSE '26)
Live Platform: **insurevsb.vercel.app**

1. THE HUMAN STORY: WHY DOES INSURE EXIST?

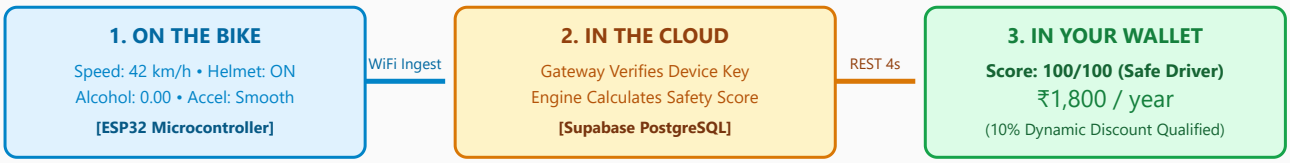

In traditional motor insurance, two neighbors buying the identical electric scooter pay the exact same annual price: **₹2,000 every year**.

> 🛵 **Ravi (The Safe Commuter):**
> Always wears a helmet, cruises at 35–45 km/h, maintains distance, and has never had an accident. In traditional insurance, he is *unfairly overpaying* to sponsor reckless speeders.

> 🏍️ **Rahul (The Risky Commuter):**
> Takes off his helmet, speeds at 95 km/h, brakes violently at the last second, and rides aggressively. Traditional insurance gives him zero financial incentive to slow down.

INSURE's Philosophy: "Drive safe, pay less (₹1,800). Drive dangerous, pay more (₹2,400). Transparent and fair."

2. HOW DATA BECOMES MONEY (THE 3-STEP JOURNEY)

3. THE 4 LIVE DEMONSTRATION SCENARIOS

🟢 Scenario A: The Safe Commute (Ravi's Ride)

Score: 100/100 → 10% Discount

Sensor Signals: Speed: 38–42 km/h | Helmet Switch: ON (Pin 19) | Alcohol: 0.00 ppm | Accel: 0.6 m/s² (Nominal 1.0g)
Calculation: Speeding Risk = 0, Braking Risk = 0 → Score = 100 → Premium: **₹1,800/yr (Save ₹200)**.
Judges Pitch: "Ravi cruises at 42 km/h with his helmet on. Our engine awards 100 points, qualifying him for an instant ₹200 savings."

🔴 Scenario B: The Risky Highway Run (Rahul's Joyride)

Score: 42/100 → +20% Surcharge

Sensor Signals: Speed: 95 km/h (Limit: 80) | Helmet: OFF (Violation) | Harsh Braking: -5.2 m/s² | Pot: 0.28 ppm
Calculation: Speeding Risk = 50, Braking = 65 → Score = 42/100 → Premium: **₹2,400/yr (+₹400 Risk Penalty)**.
Judges Pitch: "Rahul takes off his helmet and speeds at 95 km/h. The engine flags elevated risk and charges a fair 20% surcharge."

🟡 Scenario C: Sudden Crash Impact Spike (Neutrality Guarantee)

Impact: 7.42g → Fault: UNKNOWN

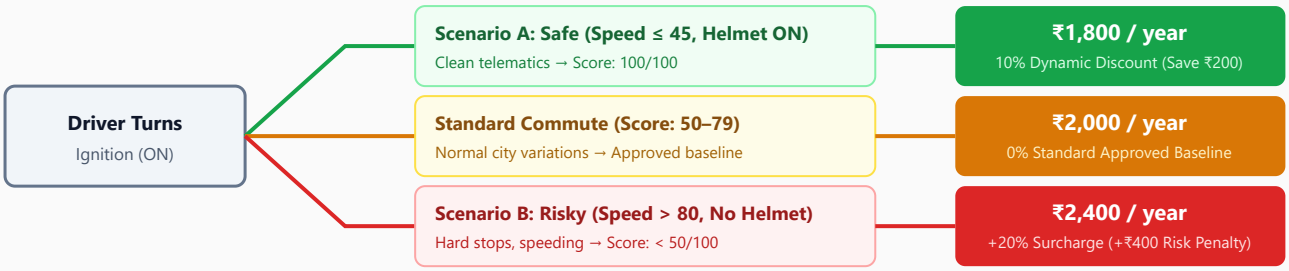

Sensor Signals: Severe Impact Force: 7.42g (> 5.0g trigger) | Deceleration: -18.0 m/s² | Speed: drops to 0 km/h
Compliance Innovation: An incident is logged, but **fault is strictly UNKNOWN with 0% surcharge**. No algorithmic blame occurs without licensed human adjuster review on `/review`.
Judges Pitch: "A 7.4g impact occurs! Unlike unfair black boxes, we never assume driver fault from sensors alone."

🟣 Scenario D: Two-Vehicle Correlated Crash (Bikes 001 & 002)

Multi-Vehicle Fairness

Event Action: Ather 450X and Ola S1 Pro collide. Both log concurrent high-g impacts with distinct event IDs. The system records neutral provisional incidents for both vehicles, preserving integrity until formal police/surveyor reports.

4. THE SCENARIOS & ACTUARIAL PRICING DECISION TREE

5. THE STATUTORY FAIRNESS SHIELD: PRICING VS. CLAIMS SEPARATION

6. 10-SECOND VERBAL PRESENTATION CHEAT SHEET

Scenario	What You Click	Dashboard Display	Exact Words to Say to Hackathon Judges
Scenario A	Click "*Start Safe Drive*"	100/100 SAFE DRIVER → ₹1,800/yr	"Ravi cruises at 42 km/h with his helmet on. Our engine awards 100 points, dropping his premium by 10% to ₹1,800."
Scenario B	Click "*Switch to Risky*"	42/100 ELEVATED RISK → ₹2,400/yr	"Now Rahul speeds at 95 km/h with no helmet. The engine flags elevated risk and charges a fair 20% surcharge."
Scenario C	Click "*Trigger Collision*"	7.42g Impact → Fault: UNKNOWN	"A 7.4g crash occurs! Unlike unfair black boxes, we never assume fault. The incident is UNKNOWN until human review."
Scenario D	Select *INSURE-BIKE-002*	Dual Correlated Incident Logged	"Both vehicles in the accident get neutral logging without automated algorithmic blame."
Portfolio	Open `/profitability`	Combined Ratio: 79.1%, Profit: ₹4.90L	"By rewarding safer driving, claims drop, expanding insurer underwriting profit from ₹3.0 Lakhs to ₹4.9 Lakhs."
